

Progress Report

- Increment 1 -

Group #1

1) Team Members

Name	FSUID	Github ID
Matthew Chen	mc23c	mchenrep
Mawi Otieno	mmo23b	mmot725
Richard Diaz	rjd21a	oazali
John Seibold	jcs22l	jseib-ai
Hector Martinez	Hjm23f	H-J-M-23

2) Project Title and Description

Gym logger web application. Users can sign in and save their workout templates as well as log their workouts and view an extensive exercise library. Inspired by iOS workout loggers like Strong but meant for cross platform/on the web.

3) Accomplishments and overall project status during this increment

Accomplishments:

- Basic Flask file structure set up
- Linked SQLite database to web app and seeded it
- Created model ORM to map database schemas to Flask models
- API routing
- Displayed most API routes with respective HTML templates
- Functional user sign up/login
- Functional exercise library

The project has some of the implementations initially proposed but is nowhere near the initial scope. We have the foundation that will get us to the end result (database models/operations, routing, basic skeletons for other features, exercise library, user authentication, etc.) but it will take another increment to cover most of the functionality and polish it.

4) Challenges, changes in the plan and scope of the project and things that went wrong during this increment

Challenges

- Communication
- PostgreSQL as database
- Using the Github neatly

Reasons

- Team members not responding
- Not communicating or making announcements often
- Database migration might be too complex for what this increment needs
- Forgetting to open Github issues and pull requests for actions done when initially creating the repository

Solutions

- Canvas announcements/direct messaging
- More frequent communication
- Using SQLite instead of PostgreSQL
- Being more mindful of opening Github issues and pull requests

5) Team Member Contribution for this increment

Name	Deliverables	Progress Report	RD	IT	Source Code	Video
Matthew C	File structure, basic template and skeletons for code	Sections 1,2,3,4, and 6	N/A	All	- app/ __in it __. - app/ py - mod els.p y - conf ig/se ed.p y	
Mawi Otieno	Display of exercise list page and search / filter functionality	Section 7	Section 1	N/A	- app/ exer cises /rout es.p y - temp lates /exer cises /libr ary.h tml	Exercise Library Showcase
John S	Workout logging logic	Section 5, this part		N/A		

6) Plans for the next increment

For the next increment, the goal is achieving basic functionality of all the features initially proposed (templates, logging, EDA, etc.). To achieve this, our team will communicate more frequently and check in often to make sure everyone is on the same page. So far, we have the right structure and foundation to implement the next few features, it is just a matter of execution and time.

7) **Stakeholder Communication**

Dear Stakeholders,

Development of the Gym Logger web application has progressed to the point where the primary workout logging experience is functional.

Users can currently create accounts, view the exercise library, and use exercises from the library to create a workout. Users can also create and delete reusable workout templates to immediately begin a workout with a predefined list of exercises without manual reconfiguration. During a workout, each set of an exercise is recorded with values for weight and repetitions that can be entered by the user. When a template is used, the exercise checklist automatically reflects progress as exercises are completed. Completed workout sessions are saved to the user's account and can later be reviewed through the workout history. Basic statistics are also available, currently including the total number of workout sessions over the course of a user's account.

To continue work on the project, we have adopted a structured workflow in which individual features are documented as tasks and distributed across team members. Tasks are developed and reviewed by other team members before integration, ensuring quality control as more features are added to the application.

The project is well positioned for continued development as the core structure and logic needed to support the remaining features are already in place. The existing database structure accommodates the account system, exercise library, templates, and logging system provide a strong foundation for expanding the application. As a result, we do not currently anticipate major technical obstacles when implementing the remaining planned functionality, with progress primarily depending on continued execution, testing, and team coordination.

Moving forward, development will focus on expanding workout statistics, refining existing functionality, improving the overall user experience, and continuing to add more features presented in the initial proposal.

Thank you for your support,
Gym Logger Development Team
